

Pass/fail evidence in Qwen2.5-Coder: universal causal mechanism, prior-gated behavior, deployable veto

A · Mechanism location: relative-depth law
(universal late-layer site, drifts deeper)

B · Mechanism strength: $\sim 18\times$ growth
(causal edit–noop shift vs size)

C · Behavior: prior-gated & non-monotonic
(binary unmarks 7B; 14B/32B stay edit-locked)

D · Deployment: severe over-editing across scale,
cut by the held-out edit-veto
